

AML PORTFOLIO RISK REVIEW

# AML Transaction Monitoring Analysis

---

Presented by Shwetha .G

## PORTFOLIO ANALYSIS

8.98% of transactions triggered a suspicious-activity rule

**50,000**

### Transactions

\$209.8M total  
value across 2,000  
clients.

**4,489**

SUSPICIOUS TRANSACTIONS  
\$22.2M, or 10.6% of total  
transaction value.

**60.9%**

### HIGH-RISK RATE

1218 High risk clients with  
78.2% of transactions value..

---

**Monitoring risk is material, but concentrated enough to support risk-based prioritization.**

CLIENT RISK SEGMENTATION

# High-risk clients carry most of the book and the highest alert rate

Risk tier

HIGH RISK

**1,218 clients** ·  
\$159.7M value

11.60%  
suspicious  
rate

MEDIUM RISK

634 clients ·  
\$43.9M value

4.99%  
suspicious  
rate

LOW RISK

148 clients ·  
\$6.2M value

1.53%  
suspicious  
rate

The step-down from High to Medium to Low suggests the composite rating is directionally aligned with observed activity.

STATIC RISK INDICATORS

# Static risk stacks around sanctions, country exposure, and opaque ownership

| Indicator          | Flagged clients | Rate of client base |
|--------------------|-----------------|---------------------|
| OFAC country       | 601             | 30.05%              |
| Sectoral sanctions | 575             | 28.75%              |
| FATF country       | 179             | 8.95%               |
| Ownership opacity  | 120             | 6.00%               |
| PEP                | 114             | 5.70%               |
| Sanctions          | 55              | 2.75%               |

PRIORITY LENS

Stacked flags deserve the first review pass.

Energy/Oil and Defence/Arms recur among clients with four or more static indicators.

Validate beneficial ownership and sanctions exposure before escalation.

**PEP signal:** \$6,365 average transaction versus \$4,063 for non-PEPs; suspicious rates of 10.81% versus 8.87%.

SECTOR ANALYSIS

# Energy/Oil and Defence/Arms lead sector risk, while Tech is a quiet outlier

Sector

IMPORTANT HIGHLIGHT

Tech is Low risk by classification, but not quiet in observed alerts.

Rapid movement leads every sector. Energy/Oil and Defense/Arms also lead in absolute OFAC and FATF activity.

Review Tech for sanctions-driven exposure rather than screening it out by baseline label.

COUNTRY ANALYSIS

# Country risk is concentrated in a small set of flagged populations

CONCENTRATED FLAGS

Country indicators are powerful prioritization signals—not conclusions.

All 108 Venezuela clients are OFAC-flagged. All North

Korea clients are both FATF- and OFAC-flagged. All 95 Iran clients carry both flags.

Apply enhanced KYC and sanctions screening first, then validate individual list matches.

CROSS-COUNTRY ANALYSIS

# Corridors reveal sharper concentration than country averages

| Client country | Counterparty country | Transactions | Total value  | Suspicious rate (%) |
|----------------|----------------------|--------------|--------------|---------------------|
| SY             | RU                   | 36           | \$117,597.10 | 100%                |
| VE             | IR                   | 34           | \$196,536.79 | 100%                |
| VE             | RU                   | 34           | \$116,108.41 | 100%                |
| SY             | SY                   | 32           | \$127,055.64 | 100%                |
| VE             | SY                   | 31           | \$100,343.96 | 100%                |
| VE             | VE                   | 27           | \$195,768.00 | 100%                |

PORTFOLIO CONTEXT

10.00%

Domestic suspicious rate across 2,419 records.

8.93%

Cross-border suspicious rate across 47,581 records.

Validate whether country-risk flags are driving the 100% corridor rates before escalating as confirmed illicit activity.

# Suspicious rates eased modestly as volume stayed elevated

| JULY         | AUGUST       | SEPTEMBER    |
|--------------|--------------|--------------|
| 16,141       | 17,260       | 16,599       |
| transactions | transactions | transactions |
| 1,483        | 1,520        | 1,486        |
| suspicious   | suspicious   | suspicious   |
| 9.19% - rate | 8.81%-rate   | 8.95%-rate   |

Absolute suspicious counts remain high. The data alone cannot determine whether the rate dip reflects improved monitoring or a changing activity mix.

## TRANSACTION PATTERN ANALYSIS

# The strongest behavioural signal sits in the \$5K–\$9.9K band

### Highest rate: \$5K–\$9.9K

15.43% suspicious across 4,304 transactions.

**Highest volume:** \$1K–\$4.9K with 24,268 transactions and 1,961 suspicious transactions.

Three transactions clustered just below \$10,000 should trigger review—not be treated as proof of structuring.

**Outlier:** z-score 6.18; \$154.9K transaction versus a \$7.1K client average.

## ALERT DRIVERS · INVESTIGATION PRIORITIES

# Monitoring workload is concentrated in two rules, with complementary coverage underneath

Triggered rates: Rapid movement 4.92% · OFAC match 3.58% · FATF country 1.20% · Structuring 0.69% · Trade mispricing 0.02%

Co-occurrence: 11 of 347 structuring alerts also fire rapid movement (3.2% overlap). Treat alerts as investigation leads, not proof of illicit activity.

Prioritize dominant queues; retain smaller rules for coverage.

1. **Triage:** Review rapid movement and OFAC alongside stacked country and ownership flags.
2. **Validate:** Check list matches, beneficial ownership, and corridor context before escalation.
3. **Preserve coverage:** Keep structuring and trade-mispricing active as complementary signals.
